

# AIT and Fibromyalgia

## Condition / Diagnosis

Patient was suffering from an advanced case of fibromyalgia for approximately twenty five years. When the initial intake was performed the patient was so sensitive to pain that it was impossible to even touch him. If you touched his hand lightly with a fingertip he perceived the pain as if you were beating him with a hammer. Even simple routine movement was almost impossible for this patient

Of great significance regarding this patient is the fact that he had been to a large number of other medical centers prior to coming to see us. These other facilities included, but were not limited to, Johns Hopkins Medical Center, the University of Chicago Medical Center, the Mayo Clinic in Minnesota, and numerous other advanced medical research facilities throughout the country. It is noteworthy that none of these facilities and their research teams were able to even help with a small degree of improvement in his overall condition.

## About the Patient

Age: 75

Sex: M

## Past Care / Treatment / Consultations

A large number of other medical centers, including, but not limited to, Johns Hopkins Medical Center, the University of Chicago Medical Center, the Mayo Clinic in Minnesota, and numerous other advanced medical research facilities.

## Object of Therapy

To treat the patient with the auto infusion technology for the verification of the efficacy of the therapy as applied to the specific condition: fibromyalgia

# TREATMENT & RESULTS

## Initial Treatment & Results

Upon arrival at our facility he reluctantly went through the intake procedure. He expressed openly his lack of confidence in our ability to help him in anyway. He reiterated the numerous attempts at other highly qualified facilities and their total failure and inability to assist him in finding any means of improvement of his condition. Our team recommended a series of Auto Infusion therapy and we all were concerned with his ability to even be able to receive the therapies due to his inability to move or position himself in our laboratory facility. With much care and concern our team started the Auto Infusion Technology. It became apparent during the first session that the level of his pain threshold may very well limit his capacity to receive the benefit of our technology. He literally screamed and cried throughout the entire first treatment. With great reluctance several days later he received a second treatment. During this session our entire team observed the significant improvement in his capacity to undergo the therapy.

# TREATMENT & RESULTS

## Subsequent Progress

He anxiously came to our facility for a third session. The third session was given without any pain or discomfort whatsoever. At the conclusion of the therapy the patient was able to move out of our laboratory suite without any pain or assistance of any type. He tearfully indicated to our team that this was the first time in over twenty five years that he had felt this degree of well-being. That weekend he went on an extended hike and walk in the mountains for the first time in many years. He continued treatment at our facility the next week with ongoing improvement with each session. He reluctantly left our facility to return to the east coast due to business and family responsibilities. We have followed up with this patient for a significant period of time. Each time we have contacted him he indicates that he had remained free of any significant pain or discomfort and has been able to return to a normal level of physical activities.
